

AI Audit Report

1. Declaration

I use AI tools for planning, generating, reviewing, and repairing the Playwright automation for FR-02, FR-07, and FR-16. I remain responsible for comparing every assertion with the SRS and for executing the final suite.

2. Interaction Log

Interaction 1 - Initial architecture

- **Tool:** Gemini 3.1 Pro
- **Date/time:** 2026-08-16 20:47 +07:00
- **Prompt:** "Lên kế hoạch test cho FR-02, FR-07, FR-16 dựa trên SUT README; tạo Page Object Model và tách test data CSV/JSON."
- **AI output:** Proposed `LoginPage`, `CartPage`, `AdminImportPage`, JSON messages, credential/product CSV files, and Playwright specs.
- **Human review:** The generated POM and fixtures were retained as a starting point, but the first implementation only imported some CSV files without iterating them.

Interaction 2 - Test generation

- **Tool:** Gemini 3.1 Pro
- **Date/time:** 2026-08-16 20:48 +07:00
- **Prompt:** "Sinh ít nhất 12 test cho mỗi feature, dùng tối thiểu ba assertion pattern và giữ assertion theo SRS cho các case @bug."
- **AI output:** Generated three specs with 38 initial tests and UI/API assertions.
- **Human review:** Weak total assertions, hardcoded payloads, and incomplete lockout checks were identified. Several red results were automation failures rather than SUT defects.

Interaction 3 - Multi-browser configuration

- **Tool:** Gemini 3.1 Pro
- **Date/time:** 2026-08-16 20:50 +07:00
- **Prompt:** "Cấu hình Playwright cho Chromium, Firefox, WebKit; tự khởi động backend/web/admin và hiển thị Run by: 23127259 cùng ISO timestamp."

- **AI output:** Added three projects, three web servers, metadata, HTML/JSON reporters, and a multi-browser runner.
- **Human review:** The runner originally ignored process failures and Firefox/WebKit were not installed, so the generated reports were not valid browser evidence.

Interaction 4 - Repository audit and repair

- **Tool:** OpenAI Codex
- **Date/time:** 2026-08-24 16:45-17:07 +07:00
- **Prompt:** "Hãy đọc kĩ đề rồi từ đó bổ sung những cái còn thiếu và chưa làm cho tôi."
- **AI output:** Re-read the eight-page assignment; repaired POM navigation/selectors; converted fixtures to real DDT; expanded the suite to 45 cases; separated `@bug` and unexpected failures; installed browser engines; generated nine reports; verified metadata visually; created and validated an Agent Skill; completed Markdown/PDF deliverables.
- **Human review required:** The student must inspect the diffs and reports, record both videos with their own identity/voice, create GitHub Issues, and open/merge a real Pull Request. AI did not claim or fabricate those external artefacts.

3. Verification Evidence

- Non-bug Chromium gate: 24/24 passed.
- Full matrix: 72 passed, 63 intentional `@bug` failures, zero unexpected failures.
- Visible metadata verification: nine of nine HTML reports passed.
- Agent Skill validation: `Skill is valid!` from `quick_validate.py`.
